

Greedy Algorithms

Yan Gu

How to be greedy?

- **Only care about the immediate reward for any decision make!**
- **I have a few homework assignments to do, which one should I start first?**
 - (For simplicity, we assume you can always get full score using a certain time)
 - A. Work on the one with the earliest deadline!
 - B. Work on the one that worth the highest points!
 - C. Work on the easiest one that requires the least time!
 - D. Work on the hardest one that requires the most time!
 - Etc.
- **Which one do you like most?**

How to be greedy?

- Today is Oct 5th.

141 programming II
Due Oct 13th
2 points
Takes 5 days

141 written II
Due Oct 20th
5 points
Takes 8 days

Homework in
course A
Due Oct 18th
3 points
Takes 4 days

Homework in
course B
Due Oct 8th
1 points
Takes 3 days

(If there's another set of assignments with deadline/points, the performance of each greedy strategy may be different.)

A. Deadline first: 6pts in total

Oct 5 - 7: HW in course B, 1pt!

Oct 8 - 12: 141 programming II, 2pts!

Oct 13 - 16: HW in course A, 3pts!

(missed the deadline of 141 written II on 20th)

B. Highest score first: 8pts in total

Oct 5 - 12: 141 written II, 5pts!

(missed the deadline of HW in course B on 8th)

(missed the deadline of 141 programming II on 13th)

Oct 13 - 16: HW in course A, 3 pts!

C. Shortest first: 4pts in total

Oct 5 - 7: HW in course B, 1pt!

Oct 8 - 11: HW in course A, 3 pts!

(missed the deadline of 141 programming II on 13th)

(missed the deadline of 141 written II on 20th)

D. Longest first: 8pts in total

Oct 5 - 12: 141 written II, 5pts!

(missed the deadline of HW in course B on 8th)

(missed the deadline of 141 programming II on 13th)

Oct 13 - 16: HW in course A, 3pts!

How to be greedy?

- Today is Oct 5th.

141 programming II
Due Oct 13th
2 points
Takes 5 days

141 written II
Due Oct 20th
5 points
Takes 8 days

Homework in
course A
Due Oct 18th
3 points
Takes 4 days

Homework in
course B
Due Oct 8th
1 points
Takes 3 days

A. Deadline first: 6pts in total

B. Highest score first: 8pts in total

C. Shortest first: 4pts in total

D. Longest first: 8pts in total

One better solution than all above: 9pts in total

Oct 5 - 7: HW in course B, 1pt!

Oct 8 - 11: HW in course B, 3pts!

(missed the deadline of 141 programming II on 13th)

Oct 12 - 19: 141 written II, 5pts!

(If there's another set of assignments with deadline/points, the performance of each greedy strategy may be different.)

Optimization Problems

- **A class of problems in which we are asked to**
 - Find a **set** (or a **sequence**) of “**items**”
 - That satisfy some **constraints** and simultaneously optimize (i.e., **maximize** or **minimize**) some **objective function**
- **A sequence of tasks with workload/deadline/reward, maximize reward while finish before deadline**
 - Items: tasks; constraints: finish before deadline; optimize: total reward
- **A set of products with weight/value, put into a bag of a certain weight limit and, maximize value**
 - Items: products; constraints: weight limit; optimize: total value
- **A file in computer, encode/compress it to minimize the length**
 - Items: codes; constraints: original file recoverable; optimize: code length
- **Shortest-paths, minimum spanning tree, etc.**

Being greedy?

- **Only care about the immediate reward!**
 - When making a decision, always choose the “best” based on a certain criterion
- **May lose the overall earnings in a long-term...**
 - Conclusion: Plan ahead when you work on homework assignments!
 - (and don't give up programming assignments of 141)
 - **Greedy solution is not necessarily optimal!**
- **Sometimes greedy may also be good enough?**
 - When you can prove it!

Example: Buying Gifts

Buying gifts

- Yihan is going to buy candies for 141 students
- Her budget is s dollars
- There are n candies in store, with price $p[i]$ each
- She wants all candies to be different
- She wants to buy **as many candies as possible**

\$5

\$2

\$4

\$7

\$15

\$5

\$7

\$9

\$1

Buying gifts

- Lowest price first!
- Consider the budget $s = 30$
- Can buy 6 items in total

total = 12

\$5

total = 3

\$2

total = 7

\$4

total = 24

\$7

total = 17

\$5

total = 1

\$1

\$15

\$9

\$7

Buying gifts

- Other solutions with 6 candies?

total = 8

\$5

total = 3

\$2

total = 12

\$4

total = 19

\$7

\$5

total = 1

\$1

\$7

\$15

total = 28

\$9

Buying gifts

- Other solutions with 6 candies?

total = 7

\$5

total = 2

\$2

total = 16

\$4

total = 23

\$7

total = 12

\$5

\$1

total = 30

\$7

\$9

\$15

The image displays several candy products with their prices and some combinations marked as solutions. The items and their prices are: a bag of M&M's Peanut Butter Chocolate Candies (18.4oz) for \$5; a small box of M&M's for \$2; a lollipop for \$4; a box of Mentos Fruit for \$5; a single blue-wrapped candy for \$1; a bag of Gummi Mix for \$7; a jar of Starburst Jellybeans for \$9; and a box of Chocolate Frog for \$15. Green checkmarks are placed over the M&M's Peanut Butter bag, the Mentos box, the lollipop, the Gummi Mix bag, and the Chocolate Frog box. Lines connect these items to their respective totals: M&M's Peanut Butter (\$5) + M&M's (\$2) = 7; M&M's Peanut Butter (\$5) + Lollipop (\$4) = 9; M&M's Peanut Butter (\$5) + Gummi Mix (\$7) = 12; M&M's Peanut Butter (\$5) + Chocolate Frog (\$15) = 20; M&M's Peanut Butter (\$5) + Mentos (\$5) = 10; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) = 16; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Chocolate Frog (\$15) = 24; M&M's Peanut Butter (\$5) + Gummi Mix (\$7) + Chocolate Frog (\$15) = 27; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) + Chocolate Frog (\$15) = 31; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) + Starburst (\$9) = 35; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) + Starburst (\$9) + Chocolate Frog (\$15) = 50; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) + Starburst (\$9) + Chocolate Frog (\$15) + Mentos (\$5) = 55; M&M's Peanut Butter (\$5) + Lollipop (\$4) + Gummi Mix (\$7) + Starburst (\$9) + Chocolate Frog (\$15) + Mentos (\$5) + Single Candy (\$1) = 56.

Buying gifts: the first decision

- Buying the \$1 candy is never a bad idea
- If you don't buy it in an optimal solution, you can always substitute any chosen candy with the cheapest one!
 - So why don't we buy the cheapest candy? It never hurts!

Buying gifts: a greedy algorithm

- If possible, but the cheapest available candy
- Repeat until no candies left or leftover money is insufficient

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties
 1. **Greedy Choice:** The greedy choice is part of the optimal answer
 2. **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem
 - After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Buying gifts: revisit the greedy choice

- The cheapest candy is always in ONE OF the optimal solutions
 - If not, I can always substitute any chosen candy to the cheapest one, and this is still an optimal solution!

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties

1.  **Greedy Choice:** The greedy choice is part of the answer

2. **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem

- After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Buying gifts: optimal substructure

- Global optimal solution is the cheapest candy + ONE OF the optimal solutions for the subproblem without the cheapest candy

Buying gifts: optimal substructure

- Global optimal solution is the cheapest candy + ONE OF the optimal solutions for the subproblem without the cheapest candy
 - Assume to the contrary that the optimal solution is \$1 candy + another solution

Buying gifts: optimal substructure

- **Global optimal solution is the cheapest candy + ONE OF the optimal solutions for the subproblem without the cheapest candy**
 - Assume to the contrary that the optimal solution is \$1 candy + another solution
 - Then \$1 candy + optimal solution for the rest is no worse

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties
 1.  **Greedy Choice:** The greedy choice is part of the answer
 2.  **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem
 - After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Buying gifts: a greedy algorithm

- If possible, but the cheapest available candy // **greedy choice**
- Repeat until no candies left or run out of money // **optimal substructure**

Example: Kayaking!

Kayaking

- n 141 students go kayaking
- Each kayak can take 1 or 2 person(s)
 - Same price
 - Same weight limit w
- Given the weight of all students $a[i]$
- What's the smallest number of kayaks needed?

Kayaking

- $a[] = 1, 3, 5, 6, 8, 10, 12, 16, 18, 19$
- $w = 20$

Kayaking

- $a[] = 1, 3, 5, 6, 8, 10, 12, 16, 18, 19$

- $w = 20$

- **Solution 1:**

- Start with the lightest student $a[1]$, pair it with the heaviest s.t. they can be in one kayak
- $(1, 19)$
- $(3, 16), (18)$
- $(5, 12)$
- $(6, 10)$
- (8)
- 6 in total

Kayaking

- $a[] = 1, 3, 5, 6, 8, 10, 12, 16, 18, 19$

- $w = 20$

- **Solution 2:**

- Start with the heaviest student $a[n]$, pair it with the heavies s.t. they can be in one kayak
- (19, 1)
- (18)
- (16, 3)
- (12, 8)
- (10, 6)
- (5)
- 6 in total

Kayaking

- **Actually, both will give you an optimal solution!**
- **Why????**
- **Take solution 1 as an example**
 - Start with the lightest student $a[1]$, pair it with the heaviest s.t. they can be in one kayak

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties
 1. **Greedy Choice:** The greedy choice is part of the answer
 2. **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem
 - After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Kayaking: greedy choice

- The greedy choice is part of the answer
- Start with the lightest student A_1 with weight a_1 , pair it with the heaviest student (say X with weight x) s.t. they can be in one kayak
- Is (A_1, X) always part of ONE OF the optimal solutions?
- If not ... assume A_1 is paired with student Y with weight $y < x$ (why?)
 - X is either alone, or paired with student Z
 - Then we can swap X and Y
 - $(A_1, Y), (X, Z) \rightarrow (A_1, X), (Y, Z)$ or $(A_1, Y), (X) \rightarrow (A_1, X), (Y)$
 - We know $a_1 + x \leq w$
 - $y + z < x + z \leq w$, so kayak (Y, Z) is also valid
 - Hence, for any optimal solution, we can modify it and make (A_1, X) part of it

Kayaking: greedy choice

- The greedy choice is part of the answer
- Or ..., if we cannot find anyone to pair with A_1 , then the kayak (A_1) must be in the optimal solution

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties

1.  **Greedy Choice:** The greedy choice is part of the answer

2. **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem

- After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Kayaking: optimal substructure

- **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem
- **After we pair A_1 with X , what happens?**
- **Claim: the optimal solution of the problem with choosing (A_1, X) is**
 - (A_1, X) + optimal solution of assigning boats to the rest $n-2$ students
 - Why? Assume to the contrary it is not, it is (A_1, X) + solution B , where B is worse than the “optimal solution of assigning boats to the rest $n-2$ students”.
 - Why don't we substitute B with the “optimal solution of assigning boats to the rest $n-2$ students”?
- **Similar for the case when we cannot pair A_1 with anyone**

Prove the optimality of a greedy algorithm

- To prove optimality of a greedy strategy, we have to prove the following two properties

1.  **Greedy Choice:** The greedy choice is part of the answer

2.  **Optimal Substructure:** The optimal solution to the big problem contains the optimal solution to the sub-problem

- After making the first choice,
 - The final best solution is first choice + best solution for the rest of (compatible) input
 - We can solve the same optimization problem recursively!

Recap

- **The greedy strategy is widely used in optimization problems**
 - When making a decision, always choose the “best” based on a certain criterion
 - Easy to design and implement, but not necessarily optimal
- **To prove the optimality of your greedy algorithm, you need to show**
 - Your greedy choice is always part of ONE OF the optimal solutions
 - Optimal substructure so you can recursively apply greedy choice and get the entire solution
- **Programming HW 2 is ready, and Problems B, C, and D can be solved using greedy algorithms**
 - Can try them now!

About UCRPC

- **Many of you have attended the competition, and did pretty well**
 - Send me an email (ygu@ucr.edu) about your name and I will give you bonus candies
- **It seems many of you enjoy algorithms and programming**
 - We have a competition programming club that has weekly practice
 - 2h training on Saturday, 1h lecture/solution, free pizza
 - Join #comp-programming at CS@UCR slack channel for more weekly info
 - The goal for the club is to prepare for ACM ICPC (International Collegiate Programming Contest), one of the most well-renown competitions
- **In addition, if you have asked and answered questions in the first few lectures, please come and write down your names**
